

Client Persona Summary

Client is a senior operations manager responsible for supervising pharmaceutical inventory, warehouse logistics, and medicine distribution. The client values accuracy, security, fast reporting, and reliable stock tracking to prevent expired medicine circulation and reduce human error. They prefer practical, efficient systems with strong user access control, barcode/batch tracking, and real-time inventory management to support daily pharmacy warehouse operations.

Questions:

“Does the system use a pre-existing medicine validation database? Is it accessible through a framework or exportable for integration? Also, how is secure access to warehouse databases managed?”

“Should barcode functionality be implemented from the beginning of the system, or will the warehouse initially rely on manual product input and management?”

“How should the system restrict and organize medicine products separately from other inventory items such as water bottles or medical device batteries?”

“From an Odoo-based system development perspective, how should controlled or scheduled medicines, or remote approval features through Odoo access permissions and automated validation when management personnel are unavailable?”

“Should the system support commission management on medicine pricing and sales transactions, or would you prefer to disable commission-related features entirely?”
